
a
Do the two criteria choose different recordings?
Single-response designs
82 of 120 identical (68%)
Grey = same recordings: the fit sees the same data, so error cannot differ (see b, at 0).
Shared (three-response) designs
26 of 40 identical (65%)
same set
different set
b
Within-network error ratio, ensemble vs nominal
identical designs cannot differ: ratio exactly 1
one network (log2 ratio +1.5)
Single
Shared
13 of 40 identical (at 0)
26 of 40 identical (at 0)
−1
0
1
log2(ensemble MSE / nominal MSE)
← ensemble lower error
higher →
Descriptive display; the primary estimand is the mean-MSE difference in c.
c
Frozen primary comparisons (40 independent networks)
Single response
−3.7% [−18.5, +12.1]
Three responses
+2.7% [−3.0, +11.5]
−20
−10
0
10
Change in mean MSE, ensemble vs nominal (%)
Both 97.5% paired network-cluster intervals include zero.
