Broad uncertainty

Response MSE of six recording policies, 40 independent networks each

Key

○ Nominal selection (open marker)

● Ensemble selection (filled marker)

— Aggregate mean over 40 networks

I Exploratory pointwise 95% network-cluster interval

Circle = single-response, square = three-response, triangle/cross = reference.

Each point is one network (truth, noise and readout repeats averaged within network). Horizontal jitter only; no point is removed.
